

Stuffs I learned from the Customer Churn Project

Technical Stuffs :

Argparse : A python tool to allow users to provide input from command line directly at the exact moment for running the scripts

Claude.md files: A skill for claude code to get to know the context every time it starts its engine for processing to a particular stuff

```
if __name__ == "__main__"
```

A conventional statement which means only run the file if it's running directly by the user as a root file not as an imported file.

Claude Code : A command line interface for software/tech guys to handle projects, automation, and even more

Setuptools: It is a python library which is used to pack all the code dependencies to one stuff and make it ready to ship and launch a new package.

Wheels : They are the actual ready to install .whl files which allows us to use the new package formed

TOML (Tom's Obvious, Minimal Language files) : These are configuration files which tell how to ship and run the codes to .whl files.

PyPI : The official App store for python packages similar to the app store in our mobile phones.

CI/CD (Continuous Integration and continuous Deployment) : Push codes and build actual real-time workflows
